10. (Canceled)

11. (Currently Amended) A form-and-seal unit for producing aseptic sealed packages of a pourable food product from a tube of packaging material filled with the food product and fed along a vertical path, the unit comprising:

a fixed structure comprising two spaced apart guides symmetrically positioned relative to a vertical longitudinal plane, wherein the vertical longitudinal plane is parallel to the two spaced apart guides;

two forming assemblies movable along the spaced apart guides;

each forming assembly comprising a pairs pair of jaws having sealing means for sealing the tube of packaging material and movable between an open position and a closed position in which the sealing means cooperate with the tube of packaging material;

a forming flap carried by each jaw and having a respective half-shell forming portion, the forming flaps of each pair of jaws being movable between a withdrawn position in which they do not cooperate with the tube and a forward position in which the respective half-shell forming portions surround the tube in the closed position of the respective jaws to form a cavity of predetermined volume;

a fixed cam;

cam-followers carried by the forming flaps and engageable with respective work profiles of the fixed cam to control movement of the forming flaps from the withdrawn position to the forward position;

the work profiles of the fixed cam comprising a first pair of work profiles and a second pair of work profiles, the first and second pairs of work profiles being spaced different distances from the vertical longitudinal plane, with the first pair of work

profiles being engageable by the cam followers of two forming flaps of a first type to

control approach movement of the two forming flaps of the first type towards the tube

and the second pair of work profiles being engageable by the cam followers of two

forming flaps of a second type, which differ in size relative to the two forming flaps of

the first type, to control approach movement of the two forming flaps of the second

type towards the tube.

12. (Previously Presented) A unit as claimed in Claim 11, wherein the first

and second work profiles form a top cam of the fixed cam, and wherein the fixed cam

also comprises a bottom cam which controls closing movement of the two forming

flaps of the first type and the two forming flaps of the second type.

13. (Previously Presented) A unit as claimed in Claim 12, wherein the

bottom cam comprises a single pair of work profiles which are engageable by the

cam followers of the two forming flaps of the first type and the cam followers of the

two forming flaps of the second type.

14. (Previously Presented) A unit as claimed in Claim 11, wherein the fixed

cam comprises a plate, and the first and second work profiles are positioned at a top

portion of the plate.

15. (Currently Amended) A form-and-seal unit for producing aseptic sealed

packages of a pourable food product from a tube of packaging material filled with the

food product and fed along a vertical path, the unit comprising:

two spaced apart guides;

each forming assembly comprising a pairs pair of jaws having sealing means for sealing the tube of packaging material and movable between an open position and a closed position in which the sealing means cooperate with the tube of packaging material;

a forming flap carried by each jaw and having a respective half-shell forming portion, the forming flaps of each pair of jaws being movable between a withdrawn position in which they do not cooperate with the tube and a forward position in which the respective half-shell forming portions surround the tube in the closed position of the respective jaws to form a cavity of predetermined volume;

a fixed cam formed as a flat plate;

cam-followers carried by the forming flaps and engageable with respective work profiles of the fixed cam to control movement of the forming flaps from the withdrawn position to the forward position;

the work profiles of the fixed cam comprising a first pair of work profiles and a second pair of work profiles which differ in size from one another, the work profiles forming the first pair of work profiles being spaced apart from one another in a widthwise direction of the fixed cam, the first pair of work profiles being offset from the second pair of work profiles in a thickness direction of the flat plate forming the fixed cam, with the first pair of work profiles being engageable by the cam followers of two forming flaps of a first type to control approach movement of the two forming flaps of the first type towards the tube and the second pair of work profiles being engageable by the cam followers of two forming flaps of a second type, which differ in size

Attorney's Docket No. 1034170-000031 Application No. 10/575,968

relative to the two forming flaps of the first type, to control approach movement of the two forming flaps of the second type towards the tube.

- 16. (Previously Presented) A unit as claimed in Claim 15, wherein the first and second work profiles form a top cam of the fixed cam, and wherein the fixed cam also comprises a bottom cam which controls closing movement of the two forming flaps of the first type and the two forming flaps of the second type.
- 17. (Previously Presented) A unit as claimed in Claim 16, wherein the bottom cam comprises a single pair of work profiles which are engageable by the cam followers of the two forming flaps of the first type and the cam followers of the two forming flaps of the second type.
- 18. (Previously Presented) A unit as claimed in Claim 15, wherein the first and second work profiles are positioned at a top portion of the plate forming the fixed cam.
- 19. (Previously Presented) A form-and-seal unit for producing aseptic sealed packages of a pourable food product from a tube of packaging material filled with the food product and fed along a vertical path, the unit comprising a fixed structure; and forming means which interact cyclically with the tube of packaging material, and in turn comprise at least two pairs of jaws having sealing means for sealing the tube of packaging material and movable between an open position and a closed position in which the sealing means cooperate with the tube of packaging

material, and respective forming flaps carried by respective the jaws and having respective half-shell forming portions, the forming flaps being movable between a withdrawn position, in which they do not cooperate with the tube, and a forward position, in which the respective half-shell forming portions surround the tube, in the closed position of the relative jaws, to form a cavity of predetermined volume; a pair of fixed cams located on opposite sides of the forming means; and a pair of camfollowers carried by each of the forming flaps and cooperating with the fixed cams to control the movement of the forming flaps from the withdrawn position to the forward position; the forming flaps being selectable from a number of types of forming flaps differing in size and for producing respective types of packages; each of the fixed cams comprising a plate possessing a first pair of work profiles engageable by the cam followers of two forming flaps of a first type to control approach movement of the two forming flaps of the first type towards the tube and a different second pair of work profiles engageable by the cam followers of two forming flaps of a second type different from the forming flaps of the first type to control the approach movement of the two forming flaps of the second type towards the tube, wherein the plate comprising each fixed cam lies in a first plane, and the first and second pairs of work profiles of each fixed cam being positioned relative to one another such that a single plane perpendicular to the first plane intersects both the first and second pairs of work profiles.

20. (Previously Presented) A unit as claimed in Claim 19, wherein the first and second work profiles form a top cam of each fixed cam, and wherein each fixed

cam also comprises a bottom cam which controls closing movement of the two

forming flaps of the first type and the two forming flaps of the second type.

21. (New) A form-and-seal unit for producing aseptic sealed packages of a

pourable food product from a tube of packaging material filled with the food product

and fed along a vertical path, the unit comprising:

two spaced apart guides;

two forming assembly's movable along the spaced apart guides;

each forming assembly comprising a pair of jaws having sealing means for

sealing the tube of packaging material and movable between an open position and a

closed position in which the sealing means cooperate with the tube of packaging

material;

a forming flap carried by each jaw and having a respective half-shell forming

portion, the forming flaps of each pair of jaws being movable between a withdrawn

position in which they do not cooperate with the tube and a forward position in which

the respective half-shell forming portions surround the tube in the closed position of

the respective jaws to form a cavity of predetermined volume;

two cam-follower rollers mounted on each forming flap and spaced apart from

one another;

two fixed cams each formed as a flat plate and spaced apart from one

another;

the two fixed cams each comprising a first pair of work profiles and a second

pair of work profiles which differ in size from one another, the first pair of work

profiles of each fixed cam being spaced apart from one another in a width-wise

direction of the fixed cam, the first pair of work profiles of each fixed cam being offset from the second pair of work profiles of the respective fixed cam in a thickness direction of the flat plate forming the respective fixed cam;

the first pair of work profiles of each fixed cam being engageable by one of the cam follower rollers of one of the forming flaps of a first type and one of the cam follower rollers of an other of the forming flaps of the first type to control approach movement of the one forming flap and the other forming flap of the first type towards the tube; and

the second pair of work profiles of each fixed cam being engageable by one of the cam follower rollers of one of the forming flaps of a second type and one of the cam follower rollers of an other of the forming flaps of the second type, which differ in size relative to the forming flaps of the first type, to control approach movement of the two forming flaps of the second type towards the tube.
